

Another short exercise

General instructions

- Work with PyCharm.
- It is recommended to 'play around' with the Python interpreter.
- Adhere to conventions.
- Check your solution before handing it in.

Another short exercise

You still need to write only one-line functions! Aren't you happy? These exercises are so short! That means:

- You can not create new lines.
- You can not use the sign ':' before a new line.
- You may use as many external modules (imports) as you like.
- You may thoroughly search the python documentation.
- You may use the dir() and help() functions.
- You may write lines as long as you want (not in accordance to conventions, **just this once**)
- Of course you still need to check your code using your main function (this can and should exceed one line).

This time we will write a function named trim_whitespace, that receives a list of strings and returns a similar list in which the strings have no whitespaces at the end (spaces, tabs and newlines).

For example:

```
>>> trim_whitespace(["hello", "hello there ", "\t\tthis is a cool exercise\t\t", "\nwow \n", "cool \n\n"])
["hello", "hello there", "\t\tthis is a cool exercise", "\nwow", "cool"]
```

Good luck!
