

# A-ok!

## General Instructions

- Use Visual Studio
- Check your solution before handing it in
- Adhere to conventions

## A-ok!

Write a function which receives a string and a positive integer containing the string's length in characters (for example, "hello" is 5 characters long). The function should change every second character in the string to the letter 'a'. Write a simple main function using it with some hard-coded value.

**Note:** Use an array for the variable holding the string in main, and not `char *`.
