

## Linux Exercise: Early Packages

The [combined\\_dpkg.log.gz](https://www.ubuntu.com/download/linux/combined_dpkg_log.gz) file contains information on packages installed on some Linux machine. Explore the file, its format and the data it contains.

For each package find the earliest (first) version ever installed. Print the package name, the version and the total number of times it was installed.

Submit the (single) command line and the output for the top 10 packages (sorted by number of installations).
