

pasta

General instructions

- Work with PyCharm
- It is recommended to 'play around' with the Python interpreter.
- Adhere to conventions.
- Remember to test your code.

pasta

Write a function named `copy_paste`, that receives a filename (as an absolute path) and copies it to a given folder.

For example:

```
>>> copy_paste(r"c:\hello.txt", r"c:\users\me")
```

This run should copy the file 'hello.txt' to the folder 'me'.

Tests you may need:

- Make sure that the function works on files other than txt (like pictures).
- Make sure that the function works on Hebrew files 😊.

Good luck!
