Jean Valjean

General instructions

- Work with PyCharm
- It is recommended to 'play around' with the Python interpreter.
- Check your solution before handing it in.
- Adhere to conventions.

Jean Valjean

Write a function that receives a 5-digit number, using the function raw_input. The function should print out:

1) The number itself.
2) The number's digits, one by one.
3) The sum of the digits.

An example of the function's run:

>>> analyze_number_digits()
Please enter your number:
24601
You entered the number: 24601
The digits of this number are: 2, 4, 6, 0, 1
The sum of the digits is: 13

You may assume that the user inserted a correct input – a 5 digit number.

Good luck!

     Omer Rosenbaum, Shay Sadovsky
